Department of Computer Applications

Rajiv Gandhi Institute of Technology, Kottayam

In the current world, there is a great increase in the utilization of digital technology and various methods are available for the people to capture images. Such images may contain important textual data that the user may need to edit or store digitally. This can be done using Optical Character Recognition with the help of Tesseract OCR Engine. OCR is a branch of artificial intelligence that is used in applications to recognize text from scanned documents or images. It is necessary to store our data in digital format in computers so that it can be accessed and edited easily by the user. This system can be used for character recognition from scanned documents so that data can be digitalized.
